ABOUT THIS PUBLICATION

This publication contains final estimates for the main commodities collected in the 2005–06 Agricultural Census. Included are detailed statistics on crop and horticulture area and production, livestock numbers, land use and industry and size characteristics of agricultural businesses. The data are based on a response rate of 93% from the 2005–06 Agricultural Census.

The ABS also plans to release a range of sub-state geographic level data in conjunction with this publication. In particular, small area data will be released in *Agricultural Commodities: Small Area Data, Australia* (cat. no. 7125.0). The sub-state outputs will generally be available as spreadsheets, data suitable for use in Geographic Information Systems, and possibly as maps. Standard outputs will be produced to approximate as closely as possible various regional structures such as river basins and Natural Resource Management regions.

CHANGES IN THIS ISSUE

Move to a new register of agricultural businesses

Until recently, the ABS had maintained its own register of agricultural establishments. However, it had become increasingly difficult to maintain this list, and users were questioning the accuracy of some of the commodity data published. The ABS investigated a number of alternatives for maintaining the register and discussed these with key users of agriculture statistics. It was agreed that the ABS should move to a new frame sourced from the Australian Taxation Office's Australian Business Register (ABR).

The ABR-based frame has been used for the first time to conduct the 2005–06 Agricultural Census. The key implication of this strategy is that census data will not be directly comparable with historical time series. This is because, in addition to the change in frame, there have been changes in methodologies used for determining whether agricultural businesses are 'in-scope' of the collection and in some of the ways the data are compiled. (For more information, please see the technical notes at the back of this publication.)

Move to a new industrial classification

The estimates in this publication are based on the Australian and New Zealand Standard Industrial Classification (ANZSIC) 2006 edition. Data in previous issues are based on the 1993 version of the ANZSIC. ANZSIC 2006 was adopted to provide a more contemporary industrial classification system, taking into account issues such as changes in the structure and composition of the economy, changing user demands and compatibility with major international classification standards.

SUMMARY OF FINDINGS INDUSTRY STRUCTURE

NUMBER OF AGRICULTURAL BUSINESSES

The 2005–06 Agricultural Census found that there were an estimated 154,472 agricultural businesses at 30 June 2006.

The beef cattle farming industry was the largest, with around 28% of all agricultural businesses. The mixed farming sector (grain-sheep/beef cattle) was the next largest with around 10%, followed by sheep farming with 8%. The Census also found that there were an estimated 16,504 non-agricultural businesses who undertook some form of agricultural activity during 2005–06.

SIZE OF OPERATIONS *EVAO of operations*

The median estimated value of agricultural operations (EVAO) of all agricultural businesses was approximately \$90,000 in 2005–06. Around 21% (33,100) had an EVAO below \$22,500, while at the other end of the scale, around 11% (17,300) had an EVAO above \$499,999.

The majority of agricultural businesses with EVAO below \$22,500 were involved in beef cattle farming (14,900) and sheep farming (2,500) while the majority of businesses with EVAO above \$499,999 were involved in grain growing (4,100), mixed grain-sheep/beef cattle farming (2,500), beef cattle farming (2,000) and dairy cattle farming (1,500).

On an industry basis, the cotton, poultry for meat, pig, poultry for eggs, and apple and pear industries were dominated by businesses with large EVAOs, with around 80%, 62%, 37%, 36% and 20% respectively, having an EVAO greater than \$499,999.

Area of operations

Most agricultural businesses in 2005–06 were between 100 and 499 hectares in size, and accounted for 47,100 (or 30% of all agricultural businesses). These businesses were mainly engaged in beef cattle grazing, dairying, sheep grazing or mixed grain-sheep/beef cattle growing.

Small operations under 50 hectares were the second main size group and accounted for 40,600 businesses (or 26%). These were mainly engaged in beef cattle grazing, grape growing, fruit and tree nut growing, vegetable growing and horse farming.

Large operations of over 2,499 hectares accounted for 9% (14,400) of all agricultural businesses and were mainly engaged in grazing or grain growing operations.

SUMMARY OF FINDINGS CROPS

OVERVIEW

For eastern Australian agricultural areas as a whole, the 2005–06 season saw near average rainfall despite 2005 winter and spring months being wet prior to dry conditions becoming established from December 2005 onwards. There were some noticeable regional variations with a particularly wet winter-spring 2005 period in large cropping areas of South Australia and in parts of Tasmania. However, in western Victoria and southern Queensland, early rain was more than offset by the dry rest of the year. The western Australian agricultural areas also experienced regional variation in climatic conditions in 2005–06. Rainfall varied from above average in the wheatbelt areas to well below average along the coast.

CROPS FOR GRAIN

Barley

The total area sown to barley for grain in 2005–06 was 4.4 million hectares. The three main growing states were South Australia (1.2 million hectares), Western Australia (1.1 million hectares) and New South Wales (1.1 million hectares). Production of barley for grain in 2005–06 was 9.5 million tonnes. Major producing states were South Australia (2.5 million tonnes), Western Australia (2.4 million tonnes) and New South Wales (2.3 million tonnes).

Grain sorghum

The total area sown to sorghum for grain in 2005–06 was 767,000 hectares. In Queensland, the main growing state, the area sown was 436,000 hectares, while in New South Wales it was reported as 327,000 hectares. Grain sorghum production in 2005–06 was 1.9 million tonnes. Production in Queensland was 1.0 million tonnes, while in New South Wales it was reported as 888,000 tonnes.

Oats

The total area sown to oats for grain in 2005–06 was 930,000 hectares. The three main growing states were New South Wales (416,000 hectares), Western Australia (271,000 hectares) and Victoria (151,000 hectares). Production of oats for grain in 2005–06 was 1.7 million tonnes. In New South Wales, production was reported as 633,000 tonnes, in Western Australia it was 591,000 tonnes and in Victoria it was 328,000 tonnes.

Rice

The total area sown to rice for grain in 2005–06 was 102,000 hectares. The main growing state was New South Wales with 101,000 hectares. Production of rice for grain in 2005–06 was 1.0 million tonnes. In New South Wales, production was reported as 992,000 tonnes.

Wheat

The total area sown to wheat for grain in 2005–06 was 12.4 million hectares. The three main growing states were Western Australia (4.8 million hectares), New South Wales (3.6 million hectares) and South Australia (2.0 million hectares). Production of wheat for grain in 2005–06 was 25.2 million tonnes. In Western Australia, production was reported as 9.1 million tonnes, in New South Wales it was 8.0 million tonnes and in South Australia it was 3.9 million tonnes.

OTHER CROPS

Canola

The total area sown to canola in 2005–06 was 972,000 hectares. The three main growing states were Western Australia (437,000 hectares), New South Wales (194,000 hectares) and Victoria (191,000 hectares). Production of canola in 2005–06 was 1.4 million tonnes. In Western Australia, production was reported as 617,000 tonnes, in New South Wales it was 314,000 tonnes and in Victoria it was 273,000 tonnes.

SUMMARY OF FINDINGS CROPS *continued*

Cotton lint

The total area sown to cotton in 2005–06 was 327,000 hectares. The main growing states were New South Wales (197,000 hectares) and Queensland (130,000 hectares). Production of cotton lint in 2005–06 was 560,000 tonnes. In New South Wales, production was reported as 345,000 tonnes, and in Queensland it was 214,000 tonnes.

Sugar cane

The total area of sugar cane cut for crushing in 2005–06 was 398,000 hectares. Queensland was the main growing state (375,000 hectares). The total quantity of sugar cane crushed in 2005–06 was 37.1 million tonnes. In Queensland 34.4 million tonnes were crushed.

SUMMARY OF FINDINGS HORTICULTURE

FRUIT

Bananas

The total area of bearing bananas in 2005–06 was 11,200 hectares. The main growing states were Queensland (9,390 hectares) and New South Wales (1,510 hectares). Production was down by around one third as a result of damage caused by Cyclone Larry in early 2006. Production in Queensland was reported as 165,000 tonnes and in New South Wales it was 15,900 tonnes.

Oranges

The number of orange trees in 2005–06 of bearing age was 6.6 million. The main growing states were New South Wales (with 3.6 million bearing trees), South Australia (with 1.6 million bearing trees) and Victoria (with 1.0 million bearing trees). Production of oranges in 2005–06 was 507,000 tonnes. In New South Wales, production was reported as 244,000 tonnes, in South Australia it was 159,000 tonnes and in Victoria it was 85,700 tonnes.

Grapes

Grape production in 2005–06 was just below the previous year's record at 2.0 million tonnes. The total area of vines increased to 169,000 hectares. The bearing area for grapes rose to 158,000 hectares while the area not yet bearing fell to 10,600 hectares.

VEGETABLES

Carrots

The total area sown to carrots in 2005–06 was 6,310 hectares. The three main growing states were Victoria (1,960 hectares), South Australia (1,260 hectares) and Western Australia (1,020 hectares). Production of carrots in 2005–06 was 265,000 tonnes. The major producing states were Western Australia (62,100 tonnes), South Australia (60,000 tonnes) and Tasmania (54,700 tonnes).

Lettuces

The total area sown to lettuces in 2005–06 was 8,050 hectares. The three main growing states were Victoria (3,640 hectares), Queensland (1,970 hectares) and New South Wales (1,290 hectares). Production of lettuces in 2005–06 was 163,000 tonnes. In Victoria, production was reported as 58,800 tonnes, in Queensland it was 53,200 tonnes and in New South Wales it was 29,800 tonnes.

Onions

The total area sown to onions in 2005–06 was 4,540 hectares. The three main growing states were South Australia (1,570 hectares), Tasmania (1,230 hectares) and Queensland (730 hectares). Production of onions in 2005–06 was 222,000 tonnes. In South Australia, production was reported as 80,800 tonnes, in Tasmania it was 68,800 tonnes and in Queensland it was 27,400 tonnes.

Potatoes

The total area sown to potatoes in 2005–06 was 35,300 hectares. The three main growing states were South Australia (9,500 hectares), Victoria (8,540 hectares) and Tasmania (6,310 hectares). Production of potatoes in 2005–06 was 1.2 million tonnes. In South Australia, production was reported as 358,000 tonnes, and in both Tasmania and Victoria it was 289,000 tonnes.

Tomatoes

The total area sown to tomatoes in 2005–06 was 7,750 hectares. The three main growing states were Victoria (3,250 hectares), Queensland (2,720 hectares) and New South Wales (1,320 hectares). Production of tomatoes in 2005–06 was 450,000 tonnes. In Victoria, production was reported as 245,000 tonnes, in Queensland it was 109,000 tonnes and in New South Wales it was 75,800 tonnes.

SUMMARY OF FINDINGS LIVESTOCK

LIVESTOCK

Milk cattle

Final estimates indicate the number of milk cattle in Australia was 2.8 million head at 30 June 2006. Victoria continued to dominate the dairy industry with a herd of 1.8 million. Respondents in Victoria indicated that numbers there were affected by a slow recovery from drought combined with low milk prices.

Meat cattle

The number of meat cattle in Australia was 25.6 million head at 30 June 2006. The dominant states in the industry were Queensland with 11.4 million head and New South Wales with 5.9 million head.

Sheep and lambs

Final estimates indicate the number of sheep and lambs in Australia was 91.0 million head at 30 June 2006. The dominant states in the industry were New South Wales with 32.1 million head, Western Australia with 22.1 million head and Victoria with 17.9 million head. Respondents indicated that there was significant destocking during the year, including on-farm deaths. The number of lambs marked in Australia was reported as 35.1 million in 2005–06.

Pigs

The number of pigs in Australia was 2.7 million head at 30 June 2006. The dominant states in the industry were Queensland with 691,000 head, Victoria with 668,000 head and New South Wales with 655,000 head.

SUMMARY OF FINDINGS MURRAY-DARLING BASIN

MURRAY-DARLING BASIN

The Murray-Darling Basin (MDB) covers an area 1,450 kilometres long and 1,000 kilometres wide and consists largely of plains rising to the Great Dividing Range on its eastern and southern rim. It includes the Australian Capital Territory, and parts of Queensland, New South Wales, Victoria and South Australia and covers 1,058,800 square kilometres or approximately one-seventh (14%) of the total area of Australia. The three main river systems that make up the Murray-Darling Basin include the Darling River and its tributaries, the Murrumbidgee River, the Lachlan River and Billabong Creek and their tributaries; and the River Murray itself and its tributaries.

Sometimes described as 'Australia's fruit bowl', in 2005-06 the MDB accounted for 54% of Australia's apple production, 87% of Australia's pear production and 95% of Australia's orange production. In addition to fruit growing, the MDB accounted for around 47% of Australia's cropping land with 46% of the 2005-06 wheat area, 52% of the 2005-06 barley area and 100% of the 2005-06 rice area.

Despite representing 18% of total grazing land, the availability of water combined with often favourable growing conditions saw the MDB account for 32% of Australia's dairy cattle at 30 June 2006 and 45% of Australia's sheep and lambs at 30 June 2006. The availability of feedgrain crops, water and close proximity to some major markets saw the MDB also account for significant intensive livestock farming with 35% of Australia's layer hens at 30 June 2006 and 62% of Australia's pigs at 30 June 2006.

Land under commercial forestry plantation	425	564	989
Grazing land(a)	68 953	315 784	384 737
Land covered by remnant vegetation or woodland not suitable for grazing(b)	3 067	9 605	12 672
Wetlands or swamps not suitable for grazing	121	1 088	1 209
Other environmentally sensitive areas	234	752	986
Land surrounding and occupied by houses and sheds and other agriculturally unproductive land	432	1 491	1 923
Other land use	331	514	846
Land use not reported	500	1 707	2 207
Total area of holding(c)	88 836	346 107	434 943
Non-agricultural land(d)	17 086	317 173	334 259
Total land area(e)	105 922	663 280	769 202

(a) Includes pastures and rangelands.

(b) Excludes commercial plantations.

(c) Total area of agricultural businesses with EVAO of \$5,000 or more.

(d) Non-agricultural land is the difference between agricultural land as reported in the Agricultural Census and the total area of the Murray-Darling Basin and the rest of Australia. It comprises conserved land, forestry, urban and unused land such as vacant Crown land, commercially unused land on Aboriginal and other Crown reserves and waste land, ephemeral lakes and mangrove swamps, as well as land relating to agricultural businesses not included in the scope of the Agricultural Census.

(e) Total area for Australia includes Jervis Bay.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains final estimates for the main commodities collected in the 2005–06 Agricultural Census and related collections (i.e. Apples and Pears Collection and Vineyards Collection). It contains detailed statistics on crops, livestock and livestock products, and industry and size characteristics of farms.

2 The main objective of the Agricultural Census is to provide benchmark information on the agriculture sector for small geographic areas. The collection has five main roles:

- to provide core production data to derive gross operating surplus and gross income for the farm sector;
- to support the determination and monitoring of agriculture policy;
- to support the determination and monitoring of natural resource and water policy as it relates to agriculture;
- to support decision makers involved in producing, supplying, marketing and trading agricultural commodities; and
- to support the monitoring of economic and social issues affecting rural communities.

3 Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

STATISTICAL UNITS USED

4 The ABS uses an economic statistics units model on the ABS Business Register (ABSBR) to describe the characteristics of businesses and the structural relationships between related businesses. The units model is used within large and diverse business groups to define reporting units that can provide data to the ABS at a suitable level.

5 The units model allocates businesses to one of two sub-populations:

- a) The majority of businesses are simple in structure and are allocated to the business population that is maintained by the Australian Taxation Office (ATO). These are termed (by the ABS) Australian Business Number (ABN) units.
- b) Businesses with more complex business structures are allocated to the business population maintained by the ABS. For agricultural businesses, these are primarily units which have multiple farm locations.

6 Together these two sub-populations comprise the ABSBR population from which respondents to the 2005–06 Agricultural Census were drawn.

SCOPE AND COVERAGE

7 The scope of the 2005–06 Agricultural Census was essentially all agricultural businesses above a minimum size cut-off recorded on the Australian Business Register (ABR) maintained by the ATO.

8 For the 2005–06 Agricultural Census, the measure of size was the ABS's Estimated Value of Agricultural Operations (EVAO) where available; or where it was not available a Business Activity Statement (BAS) turnover size was derived. A minimum size cut-off of \$5,000, based on either EVAO or BAS Turnover, was used to determine whether a unit was in-scope for the Census.

9 While the Agricultural Census frame does not contain all agricultural businesses in Australia, it is expected to provide better coverage than the previous Agricultural Survey frame since most businesses and organisations in Australia need to obtain an Australian Business Number (ABN) from the ATO for their business operations. The Agricultural Census frame is also expected to be more up-to-date as it excludes agricultural businesses with cancelled ABNs and incorporates regularly updated information on agricultural businesses from the ATO.

10 Final estimates indicate a total in-scope population of 154,000 agricultural businesses compared to approximately 130,000 establishments on the previous ABS-maintained frame of agricultural establishments.

EXPLANATORY NOTES *continued*

INDUSTRY CLASSIFICATION

11 The industry classification used in this publication differs from previous issues which used the 1993 version of the Australian and New Zealand Standard Industrial Classification (ANZSIC). This classification has since been revised. The estimates in this publication are based on the ANZSIC 2006 edition. ANZSIC 2006 was developed to provide a more contemporary industrial classification system taking into account issues such as changes in the structure and composition of the economy, changing user demands and compatibility with major international classification standards. For more information, please refer to *Australian and New Zealand Standard Industrial Classification (ANZSIC), 2006* (cat. no. 1292.0).

12 Since 1993, units in the Agricultural Census and the Agricultural Survey have been classified according to the methodology described in *Australian and New Zealand Standard Industrial Classification (ANZSIC)* (cat. no. 1292.0). Prior to 1993, establishments were classified according to the methodology described in the 1983 edition of *Australian Standard Industrial Classification (ASIC), Volume 1 – The Classification* (cat. no. 1201.0). Therefore care should be taken when making comparisons between years where different classifications have been used.

RELIABILITY OF ESTIMATES (SAMPLE ERROR)

13 The estimates in this publication are based on information obtained from respondents to the 2005–06 Agricultural Census. Since not all selected units responded, the estimates may differ from those that would have been produced if all farms had responded. One measure of the likely difference is given by the standard error (SE), which indicates the extent to which an estimate might vary by chance when not all units have responded, i.e. when a 'sample' of responses only is obtained. There are about two chances in three that a 'sample' estimate will differ by less than one SE from the figure that would have been obtained if all farms had responded, and about nineteen chances in twenty that the difference will be less than two SEs.

14 In this publication, 'sampling' variability of the estimates is measured by the relative standard error (RSE) which is obtained by expressing the SE as a percentage of the estimate to which it refers.

15 Most published estimates have RSEs less than 5%. For some states with limited production of certain commodities, RSEs are greater than 10%. Estimates that have an estimated RSE between 10% and 25% are annotated with the symbol '^'. These estimates should be used with caution as they are subject to sampling variability too high for some purposes. Estimates with an RSE between 25% and 50% are annotated with the symbol '*', indicating that the estimate should be used with caution as it is subject to sampling error too high for most practical purposes. Estimates with an RSE greater than 50% are annotated with the symbol '**', indicating that the sampling variability causes the estimates to be considered too unreliable for general use. Separate indication of the RSEs of all estimates is available on request.

EXPLANATORY NOTES *continued*

RELIABILITY OF ESTIMATES
(SAMPLE ERROR) *continued*

16 A table with RSEs for selected commodities follows:

RELATIVE STANDARD ERRORS OF SELECTED COMMODITIES—At 30 June 2006

Total pigs	1.3	3.0	2.3	1.6	2.3	2.1	—	—	1.0

— nil or rounded to zero (including null cells)

CROPS, PASTURES AND
HORTICULTURE

17 Statistics on area and production of crops relate, in the main, to crops sown during the year ended 30 June. Statistics of perennial crops relate to the position at 30 June and the production during the year ended on that date, or fruit set by that date. Statistics for apples and pears and grapes, which in some states are harvested after 30 June, are collected by supplementary collection forms and are included in this publication.

DAIRY CATTLE

18 Investigations into the 2006 Agricultural Census estimates have revealed that the frame used for the 2005 Agricultural Survey did not accurately reflect the reduction in dairy establishments due to deregulation. Hence, the 2005 figure is considered to be over-estimated, with analysis indicating that the 2005 total milk cattle estimate to be around 2.9 million, not 3.1 million as previously reported.

ABS DATA AVAILABLE ON
REQUEST

19 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. Inquiries should be made to either the National Information and Referral Service on 1300 135 070 or Linda Falzari on Hobart (03) 6222 5939.

GENERAL ACKNOWLEDGMENT

20 ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated: without it, the wide range of statistics published by the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the *Census and Statistics Act 1905*.

RELATED PUBLICATIONS

21 A range of agricultural publications is produced by the ABS, including:

- *Principal Agricultural Commodities, Australia, Preliminary*, cat. no. 7111.0
- *Selected Agricultural Commodities, Australia, Preliminary*, cat. no. 7112.0
- *Natural Resource Management on Australian Farms*, cat. no. 4620.0
- *Water Use on Australian Farms*, cat. no. 4618.0
- *Livestock and Meat, Australia — Electronic Publication*, cat. no. 7218.0.55.001
- *Livestock Products, Australia*, cat. no. 7215.0
- *Value of Principal Agricultural Commodities Produced, Australia, Preliminary*, cat. no. 7501.0
- *Value of Selected Agricultural Commodities Produced, Australia, Preliminary*, cat. no. 7502.0

EXPLANATORY NOTES *continued*

RELATED PUBLICATIONS

continued

- *Value of Agricultural Commodities Produced, Australia*, cat. no. 7503.0

22 For comparisons of the agriculture industry with other industries, users are referred to:

- *Australian National Accounts: National Income, Expenditure and Product*, cat. no. 5206.0

- *Australian National Accounts: State Accounts*, cat. no. 5220.0

23 The ABS also plans to release a range of sub-state geographic level data in conjunction with this publication. In particular, small area data will be released in *Agricultural Commodities: Small Area Data, Australia* (cat. no. 7125.0). The sub-state outputs will generally be available as spreadsheets, data suitable for use in Geographic Information Systems, and possibly as maps. Standard outputs will be produced to approximate as closely as possible various regional structures such as river basins and Natural Resource Management regions.

24 Current publications and other products released by the ABS are listed in the *Catalogue of Publications and Products* (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <<http://www.abs.gov.au>>. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

TECHNICAL NOTE OLD BASIS ESTIMATES

OLD BASIS ESTIMATES

- 1** Prior to running the 2005–06 Agricultural Census, the ABS had maintained its own register of agricultural establishments. However, it was increasingly difficult to maintain this list, to the point where it was no longer viable, and users were increasingly questioning the accuracy of some commodity data.
- 2** The ABS investigated a number of alternatives for maintaining an agricultural business register and discussed these with key users of agriculture statistics. As a result of this, it was agreed that the ABS should move to a new frame sourced from the Australian Taxation Office's Australian Business Register (ABR) for the 2005–06 Agricultural Census.
- 3** The ABR-based register consists of all businesses contained on the ABR coded to an 'agricultural' industry, as well as businesses which have indicated they undertake agricultural activities. All businesses with a turnover of \$50,000 or more are required to register on the ABR, and are provided with an Australian Business Number (ABN). Many agricultural businesses with a turnover of less than \$50,000 have also chosen to register on the ABR, for example to access subsidies that require an ABN.
- 4** Moving to the ABR-based register required making changes to many of the methodologies used for compiling agriculture statistics. These included changes in the methods used for determining whether farms were 'in-scope' of the collection, and to ways the data was compiled (please see paragraphs 7–10 of the Explanatory Notes for more information about the change in scope and coverage).

IMPLICATIONS FOR USERS

- 5** The key implication of the move to the new register is that the 2005–06 Agricultural Census data will not be directly comparable with the historical time series of agriculture data. To provide users with a way of comparing ('bridging') the 2005–06 Agriculture Census data with the historical time series, the ABS has prepared two sets of estimates for selected principal commodities (see paragraph 25).
- 6** 'New-basis' estimates have been prepared for 2005–06 using the new ABR-based register and its associated statistical methodologies. These methodologies have been subjected to rigorous analysis and testing, with the resulting 'new basis' estimates representing the start of the new commodity and livestock series.
- 7** 'Old-basis' estimates have also been prepared for a selection of principal 2005–06 agricultural commodities. These estimates are a best judgement approximation to what the 2005–06 estimates may have been if the ABS had continued to use the previous ABS-maintained list of establishments (with its associated statistical methodologies) to conduct the 2005–06 Agricultural Census.

BRIDGING METHODOLOGY

- 8** The need for a bridging strategy for the Agriculture Census was outlined in *Information Paper: Agriculture Census: ABS Views on Content & Procedures, 2005–06* (cat. no. 7103.0) and discussed extensively with key users in March 2006.
- 9** The key objective of bridging is to produce estimates that reflect what would have been obtained if no changes to the frame and statistical methodology had been made. Comparing the 'old basis' estimates with the historical time series allows the user to get an indication of the 'real world' change. Comparing the 'old basis' estimates with the 'new basis' estimates gives an indication of the impact the change to the frame and statistical methodology has had on estimates.
- 10** In order to produce 'old-basis' estimates a sample was selected from the units which could be identified and matched between the old and new frames. These common units formed the basis of the 'old-basis' or bridging estimates. In addition to these common units, all units which were common to both frames, and did not require checking to reconcile differences between the way the business is represented on the frame and how it operates in the real-world, contributed to the bridging estimates. The diagram below illustrates the contribution to bridging estimates by the two types of common units.

* Follow up required to reconcile difference between the frame and the real world situation.

METHODOLOGICAL CHANGES

11 There are two methodological changes that affect the new-basis estimates: the change in frame, specifically the change in scope, and the units model; and the change in statistical methodology, specifically the change in procedures that reconcile differences between the way the business is represented on the frame and how it operates in the real-world.

(A) THE CHANGE IN FRAME

12 The change in frame has resulted in the frame size increasing from 150,000 to 190,000 units. Not only were units added to the new frame (that is, became in-scope where they were not in-scope before, see A in Diagram and Table A) but some were removed (became out-of-scope, see C in Diagram and Table A). Changing the size and make-up of the frame will result in change to estimates even if every unit has not changed the data reported the year previously.

13 To gauge the impact of the frame change, the estimated 2005–06 values of the units that were newly out-of-scope (i.e. that had been removed from the 'old-basis' frame - see C) were compared to those of the newly in-scope units (i.e. that had been added to the frame - see A) in the sample.

(A) THE CHANGE IN FRAME
continued

14 No 2005–06 data was available for sampled units that were newly out-of-scope i.e. row C. Instead, the data these units had reported for the last three years was used to determine the average proportion of 'old-basis' estimates due to these units. Applying this proportion of the 'old basis' estimate from the common units allowed an estimate of the contribution to 'new basis' estimates from the newly out-of-scope units to be produced.

(B) THE CHANGE IN
STATISTICAL METHODOLOGY

15 The change in statistical methodology has resulted in a change in the way that some units are treated and how their data contributes to estimates (see B1 in Diagram and Table A). The impact of this change was the most difficult to measure.

16 One of the most important changes has been the way in which holdings owned by a unit were followed up when they were sold or otherwise disposed of by that unit. This process is undertaken to address known discrepancies between the frame and the real world-situation that exist at the time of sample selection. Under the old methodology, each unit in the survey which had sold or otherwise disposed of land would have been investigated to determine details of the new land-holder. If that land-holder was not already on the frame, a survey form would have been dispatched and data gathered. The new methodology dictates that this will only occur for units with an Estimated Value of Agricultural Operations (EVAO) or equivalent of greater than \$3 million, to ensure coverage of the largest land holdings does not fluctuate due to changes in ABN registration details of the operating businesses.

17 No 2005–06 data was gathered for the sampled units under the \$3 million EVAO cut off, so a value was assigned to reflect the data that would have been obtained under the old procedures. A methodology known as imputation was used to assign this value. The aim of imputation is to assign to a unit with missing data, a value as close as possible to the one that would have been obtained had data been collected. Having no data for these units made imputation difficult and it had to be assumed that these units would be similar in characteristics to the units which had not newly acquired their holding.

DECOMPOSITION

18 For illustration purposes only, table A provides an indication of what the contribution to 2005–06 'old-basis' and 2005–06 'new-basis' estimates of grain sorghum and oats production from the change in frame and change in statistical methodology may have been if the processes outlined above were used. The decomposition consists of four parts:

- A - the contribution to estimate of units that are in-scope for the new frame but not for the old frame;
- B1 - the contribution to estimate of units that are found on both frames and did require treatment to reconcile differences between the way the business is represented on the frame, and how it operates in the real world;
- B2 - the contribution to estimate of units that are found on both frames and did not require any treatment to reconcile differences between the way the business is represented on the frame, and how it operates in the real world; and
- C - the contribution to estimate of units that are in-scope for the old frame but not for the new frame.

19 Whereas the contribution to 2005–06 'new-basis' estimates could be derived using the above processes, the ABS has quality concerns with the contribution to 2005–06 'old-basis' estimates from continuing units that did require follow up to reconcile frame differences. The contribution from these units has therefore not been included in table A, and consequently the total 2005–06 'old-basis' estimate derived using the processes outlined above are also not included. Readers should note that these totals will differ to those presented in table B as the estimates provided in table B were derived using an alternative strategy as outlined in paragraph 21.

TECHNICAL NOTE OLD BASIS ESTIMATES *continued*

TABLE A, Illustrative bridging decomposition data(a)

	OLD BASIS ESTIMATE		NEW BASIS ESTIMATE	
	2004-05	2005-06	2005-06	% contribution to 2005-06
OATS-PRODUCTION (t)				
A: Units in scope of new frame but in scope of old frame	na	na	549	33
B1: Continuing units that did require follow up to reconcile frame differences	615	690	739	44
B2: Continuing units that did not require follow up to reconcile frame differences	280	np	400	24
C: Units in scope of old frame but not in scope of new frame	388	512	na	na
Total	1 283	np	1 688	100
GRAIN SORGHUM-PRODUCTION (t)				
A: Units in scope of new frame but in scope of old frame	na	na	699	36
B1: Continuing units that did require follow up to reconcile frame differences	819	721	749	39
B2: Continuing units that did not require follow up to reconcile frame differences	621	np	484	25
C: Units in scope of old frame but not inscope of new frame	571	534	na	na
Total	2 011	np	1 932	100

na not available
 np not available for publication but included in totals where applicable, unless otherwise indicated

(a) The estimates in this table were derived using the processes outlined in paragraphs 12-17 of the technical note. The 2005-06 'old basis' estimates will differ to those provided in Table B.

FINAL BRIDGED ESTIMATES

20 As a result of these difficulties and resulting quality concerns, the ABS explored an alternate strategy for producing 'old-basis' estimates for 2005-06.

21 Key considerations in the alternate strategy have included:

- analysis of the 'old-basis' estimates produced using the strategy outlined above;
- known movements between 2004-05 and 2005-06 for those units common to both the old and new frame;
- analysis of historical trends in the commodity estimates; and
- information sourced from relevant industry bodies.

22 'Old-basis' estimates based upon this strategy are presented in tables B and C at the end of this Technical Note.

INTERPRETING THE BRIDGED DATA

23 Users should exercise a degree of caution when interpreting the tables as both sets of estimates are subject to variability; the 'old-basis' estimates to both sampling and non-sampling error and the 'new basis' estimates to non-sampling error.

24 The non-sampling variability in the 'old-basis' 2005-06 estimates in particular, is expected to be significant due to difficulties experienced in collecting, processing and estimating 'old basis' data from a 'new-basis' framework. For this reason, the 2005-06 'old-basis' estimates should be used with considerable caution and movements between 2004-05 and 2005-06 considered as indicative only.

TECHNICAL NOTE OLD BASIS ESTIMATES *continued*

INTERPRETING THE BRIDGED
DATA *continued*

25 The following tables allow users to compare 2005 and 2006 estimates subject to the caveats mentioned:
